

CDC ArCO2 Study in Aug. 2024 to check its feasibility

2

Tune the XT parameters

Used Run & Condition

44	2350	747491	9:54:00	2024/8/1	10:06:41	20:00:00	E73, #9	157	GIO scaled
45	2400	236613	3:09:00	2024/8/1	20:05:34	23:14:00	E73, #9	158	GIO scaled
46	2375	518986	6:52:07	2024/8/2	10:05:53	16:58:00	E73, #9	158	GIO scaled

- Online Trigger ; CDH Cosmic (with All Seg) <— same as beam time cosmic
- Removed Scaler from DAQ data node? (Due to its wrong busy)
- ASD <— same as beam time cosmic
 - U-Vth 1.50 V, D-Vth 1.50 V
 - U-V+ 3.55 V, D-V+ 3.65 V
 - U-V- 3.39 V, D-V- 3.39 V
- Gas Flow <— I have no idea how to compare it to ArC2H6
 - Ar : CO2 = 90 : 10
 - In ~50 SCCM, Out ~45 SCCM (Mass Flow Meter)
- Temperature inside CDC ; ~ 38 °C <— same as beam time cosmic

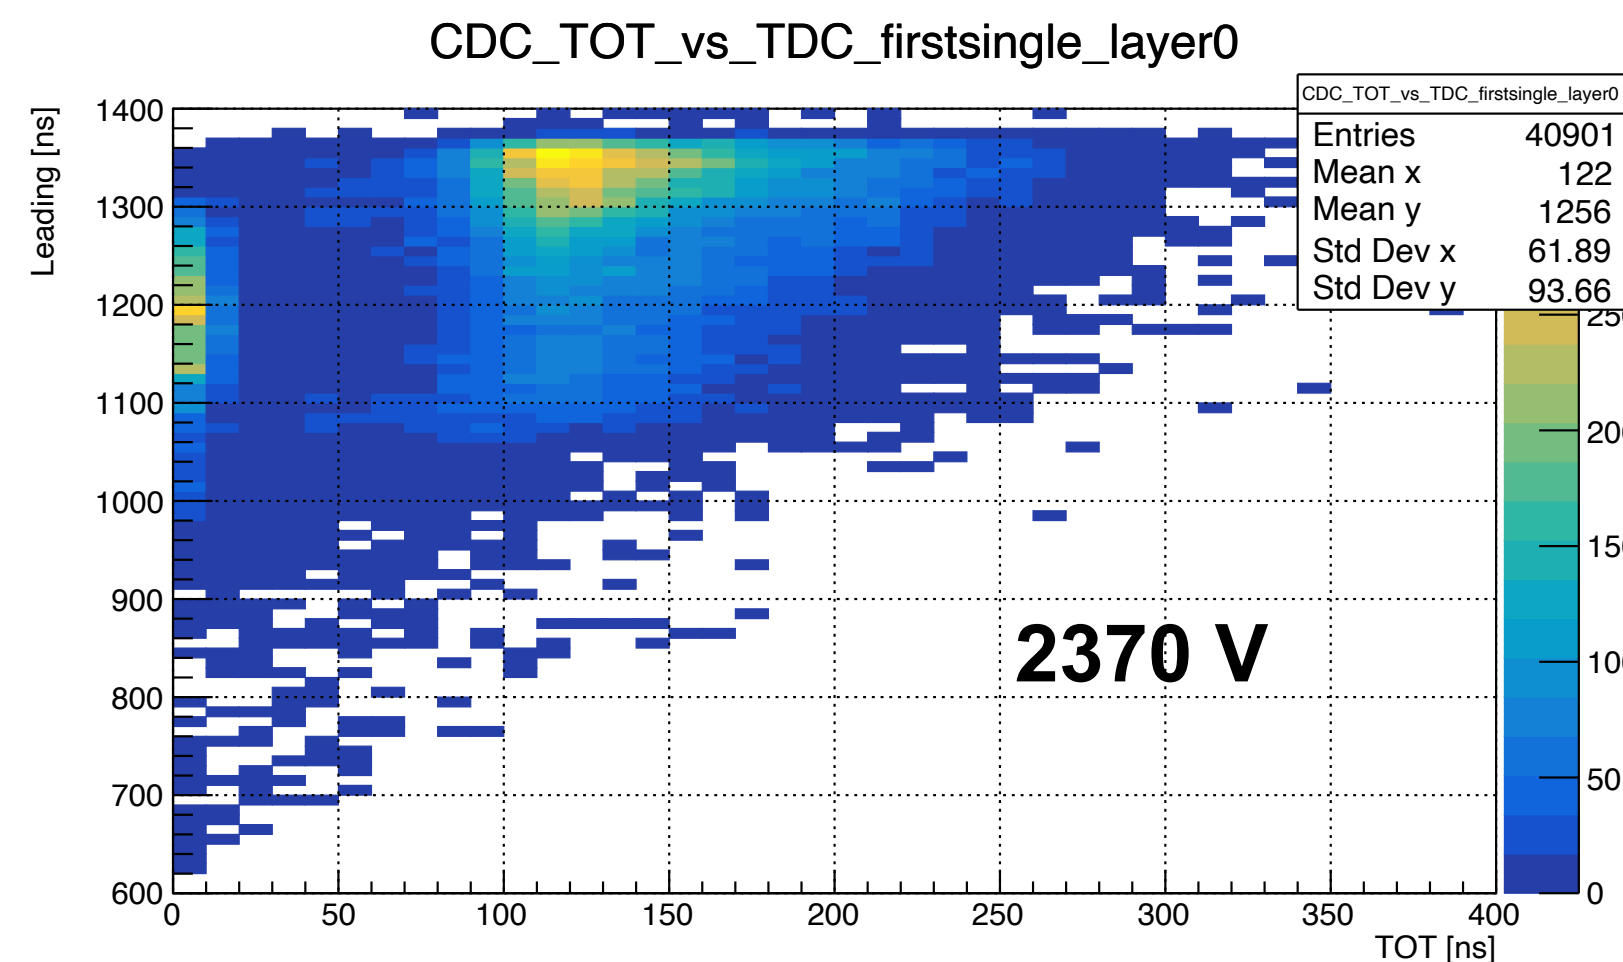

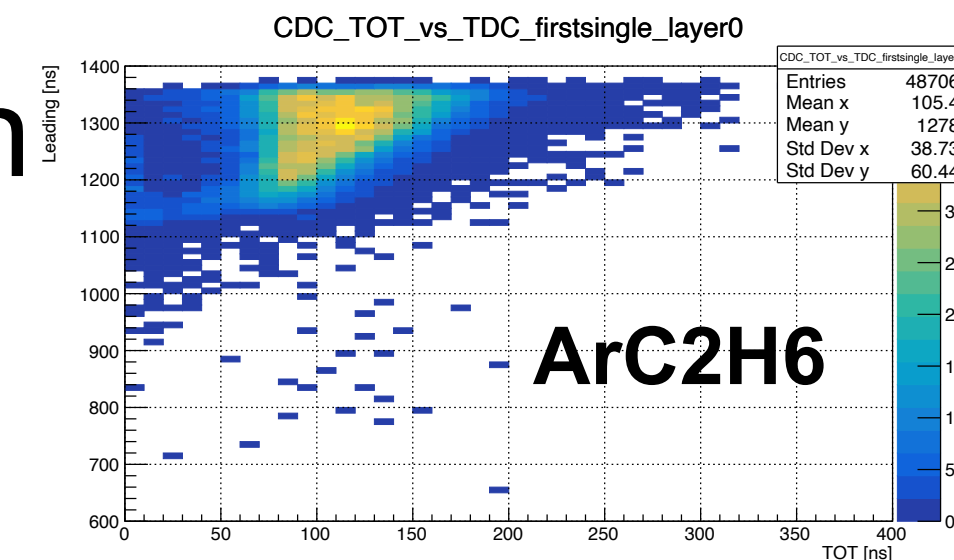

Summary of the previous discussion & its continuation

- Checked Hit pattern, Multiplicity, TDC and TOT distributions
- Compared these between the case of ArCO2 and ArC2H6

- The shapes of Mul, TDC and TOT are totally different from when using ArC2H6.
- In TOT vs TDC plot, signal region can be separated from noise region
 - e.g.) after cutting by “First Hit & Mul==2”, (using 230,000 events)

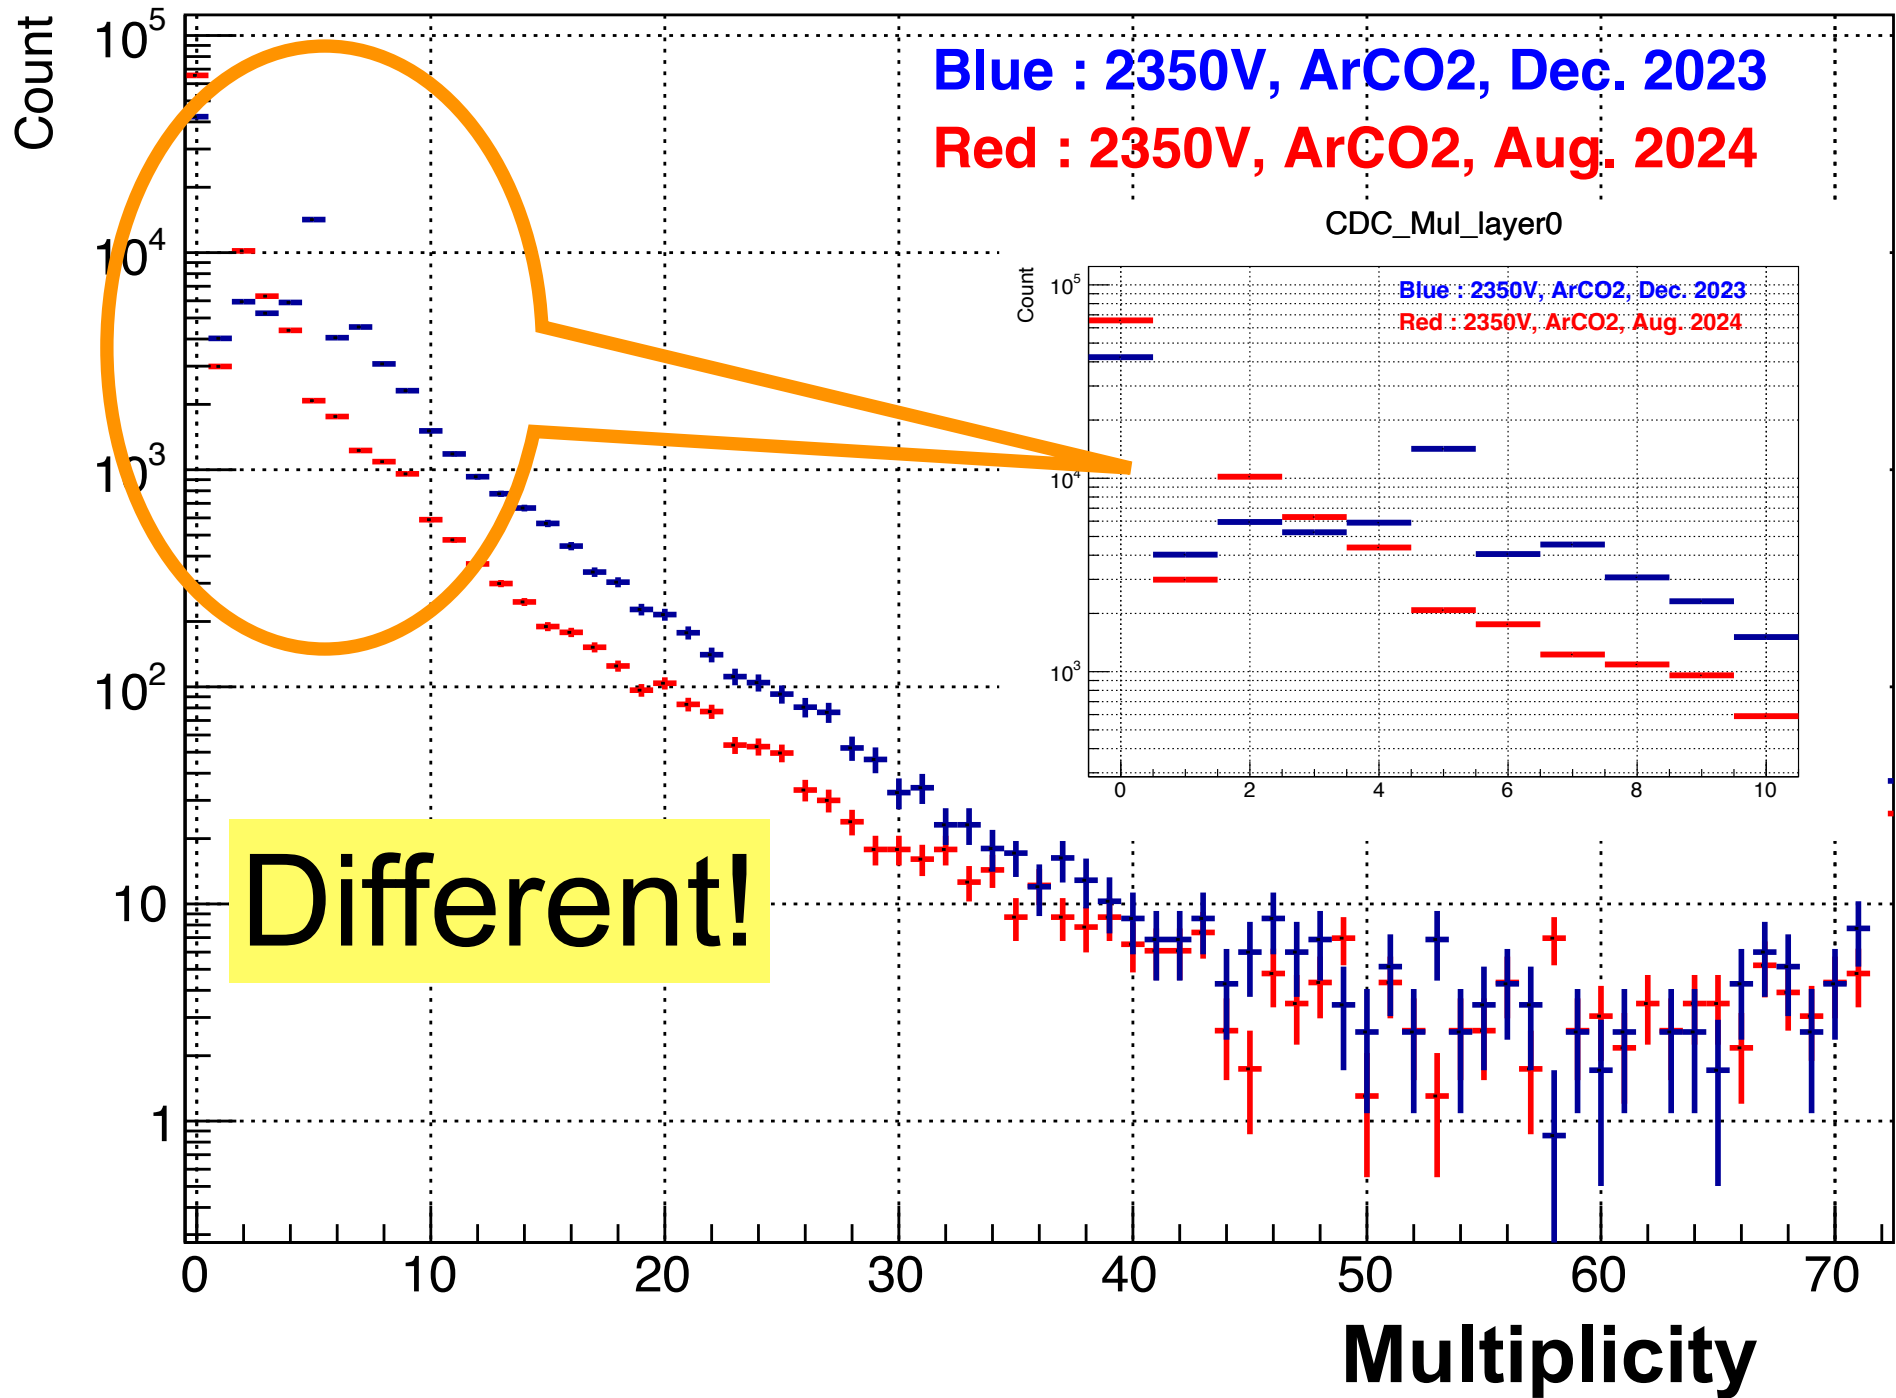

Summary of the previous discussion & its continuation

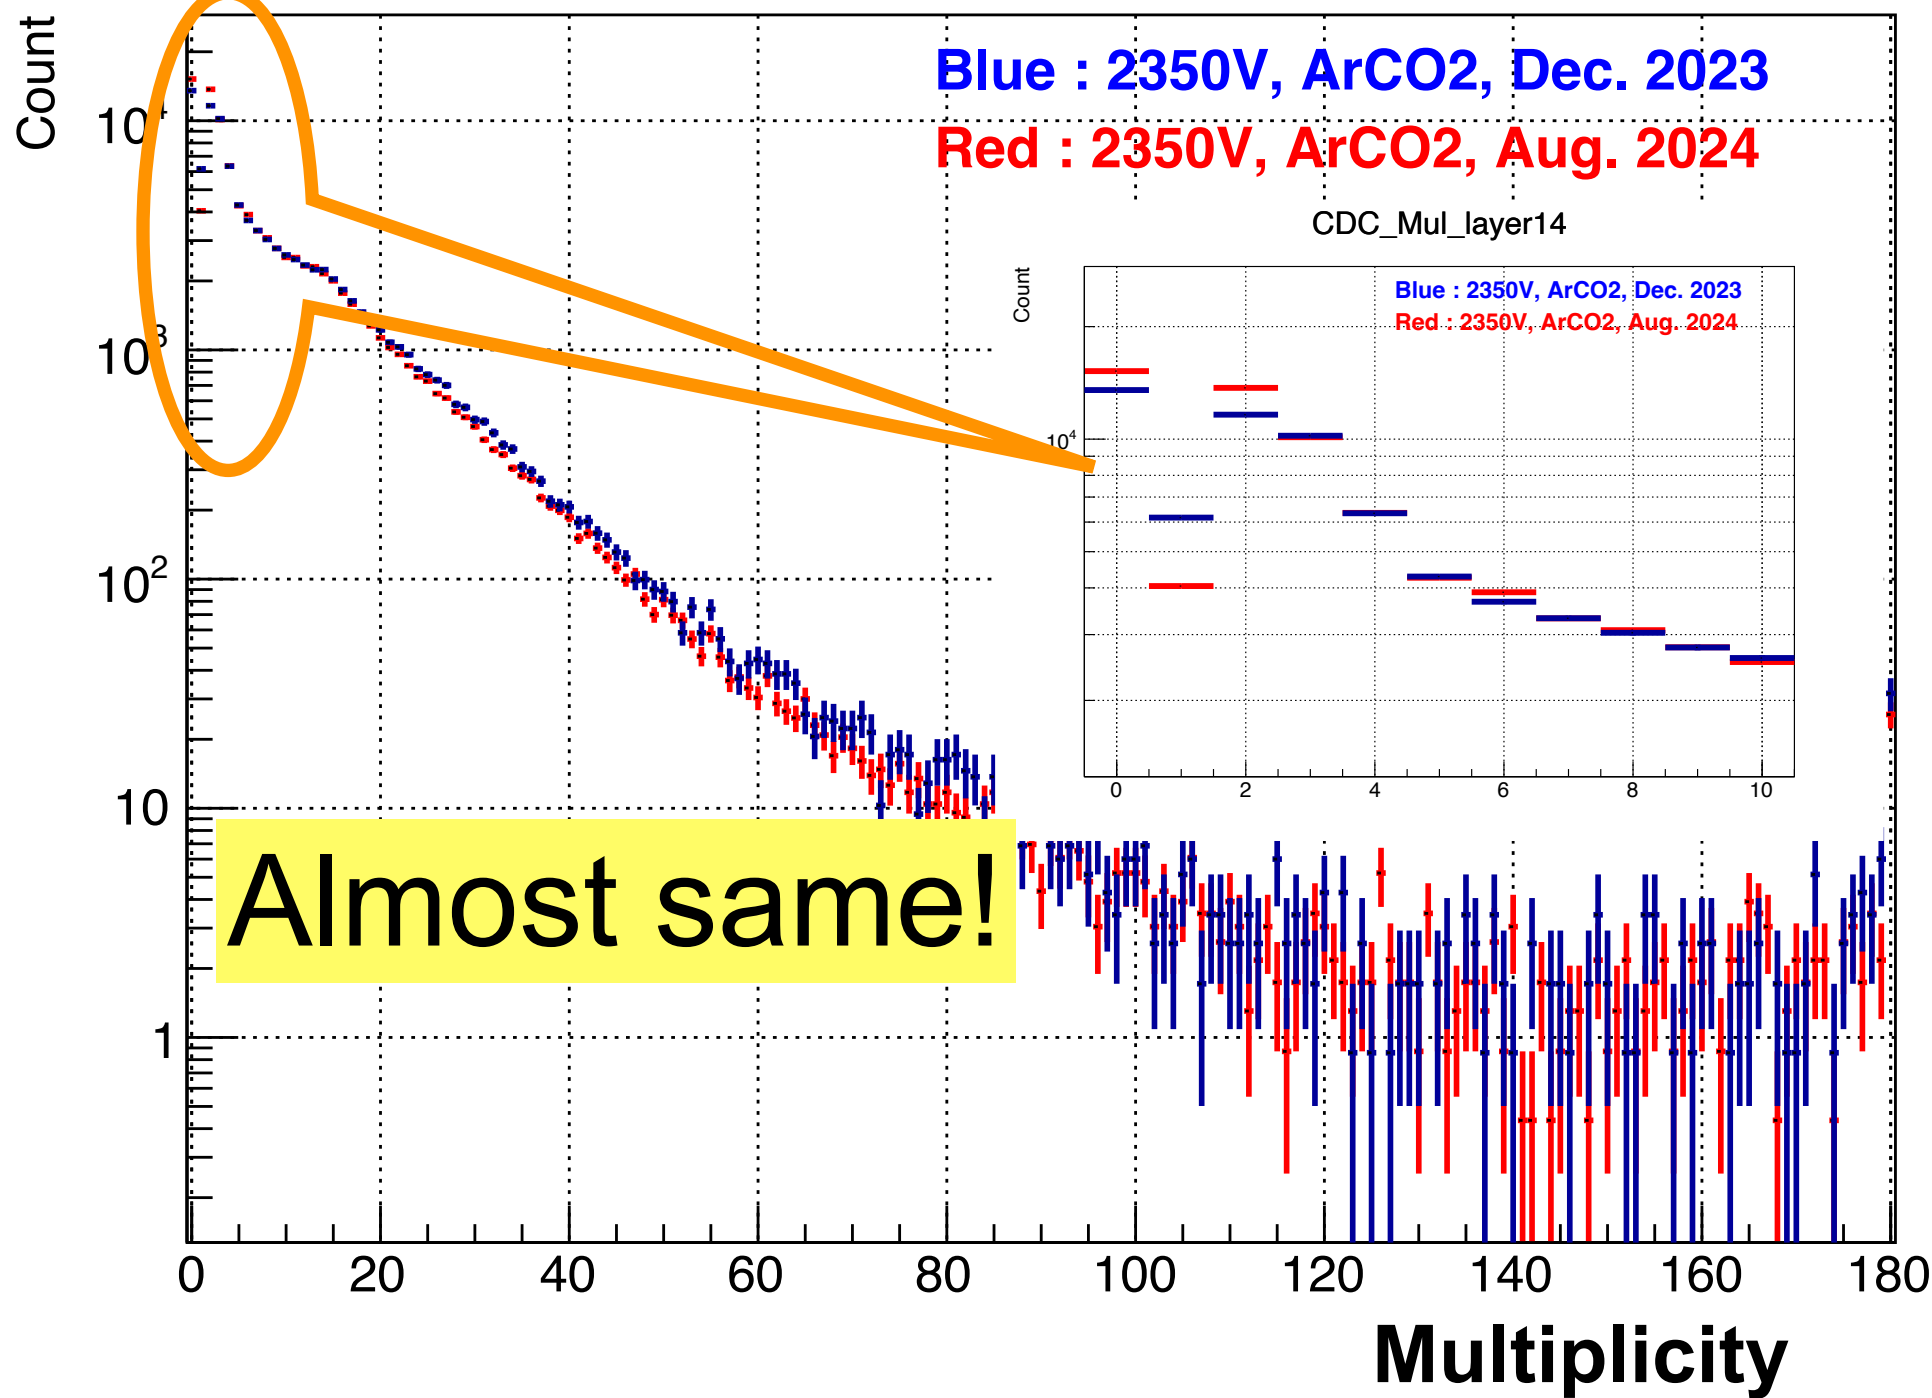

- Compare Mul with Dec. 2023
 - Used Run2 and 44 (2350V)
- Is Gurde HV the same?
- Is Gas Flow the same?
- Is temp the same?

	CDCHV	events	duration	date	start time	end time	Logbook, No	Logbook page	comment

CDC_Mul_layer0

CDC_Mul_layer14

Summary of the previous discussion & its continuation

- Compare Mul with Dec. 2023
 - Used Run24 and 45 (2400V)
 - Used CDH 8-11, 26-29 in both case
- Is Gurde HV the same?
- Is Gas Flow the same?

nts	duration	date	start time	end time	Logbook, No	Logbook page	comment

Determination of TDC offset

- Used run44, 45, 46, 600 (230,000 events)
- Used Leading TDC (after only TOT cut)
- Differentiated Hist was scalsed by *50.
- Gaussian fit (2 times iterated)
- Offset = mean value

Offset vs Layser vs HV

- With 1 sigma as error bar (~7 ns)
- Systematic shift coresponding to HV

Drift Time Before and After tuning (e.g. Layer0)

- Non event selection
- Looks good

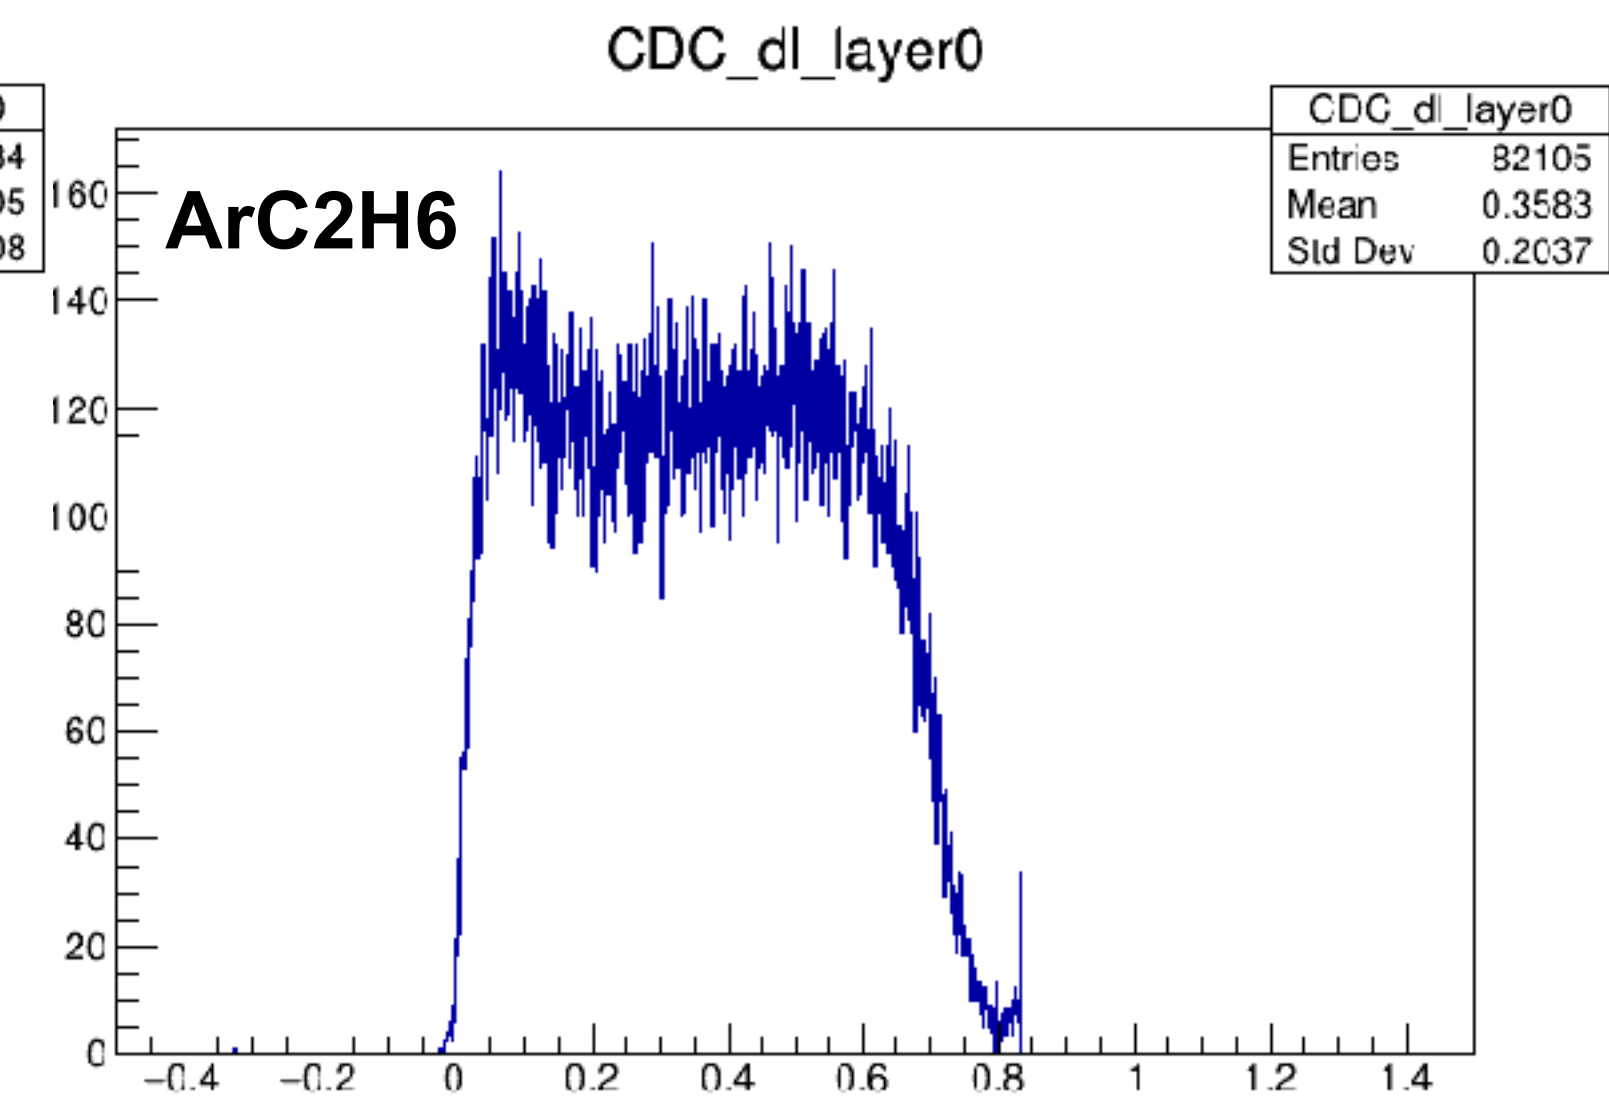

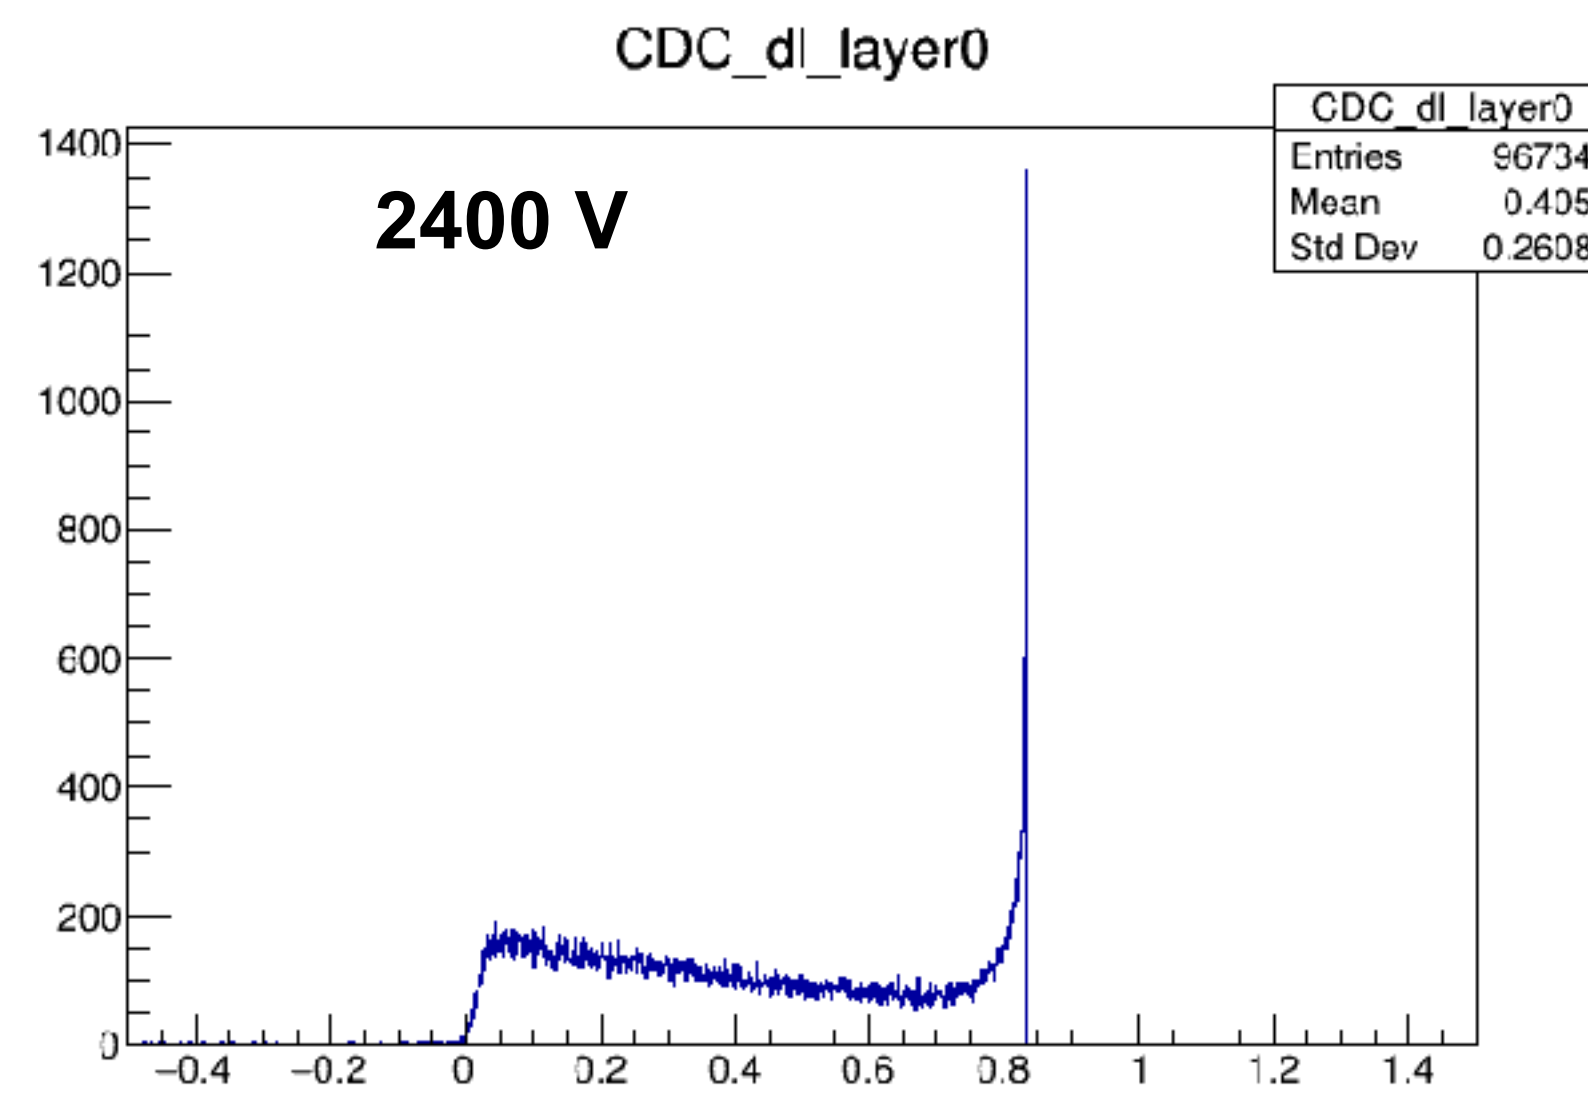

Drift Length Before tuning (e.g. Layer0)

- Used 200,000 events (CDCTree.cc)
- ArCO2 vs ArC2H6
- Of course, **Bad** in ArCO2 because of using XT param for ArC2H6

Cosmic 3min/10k ev

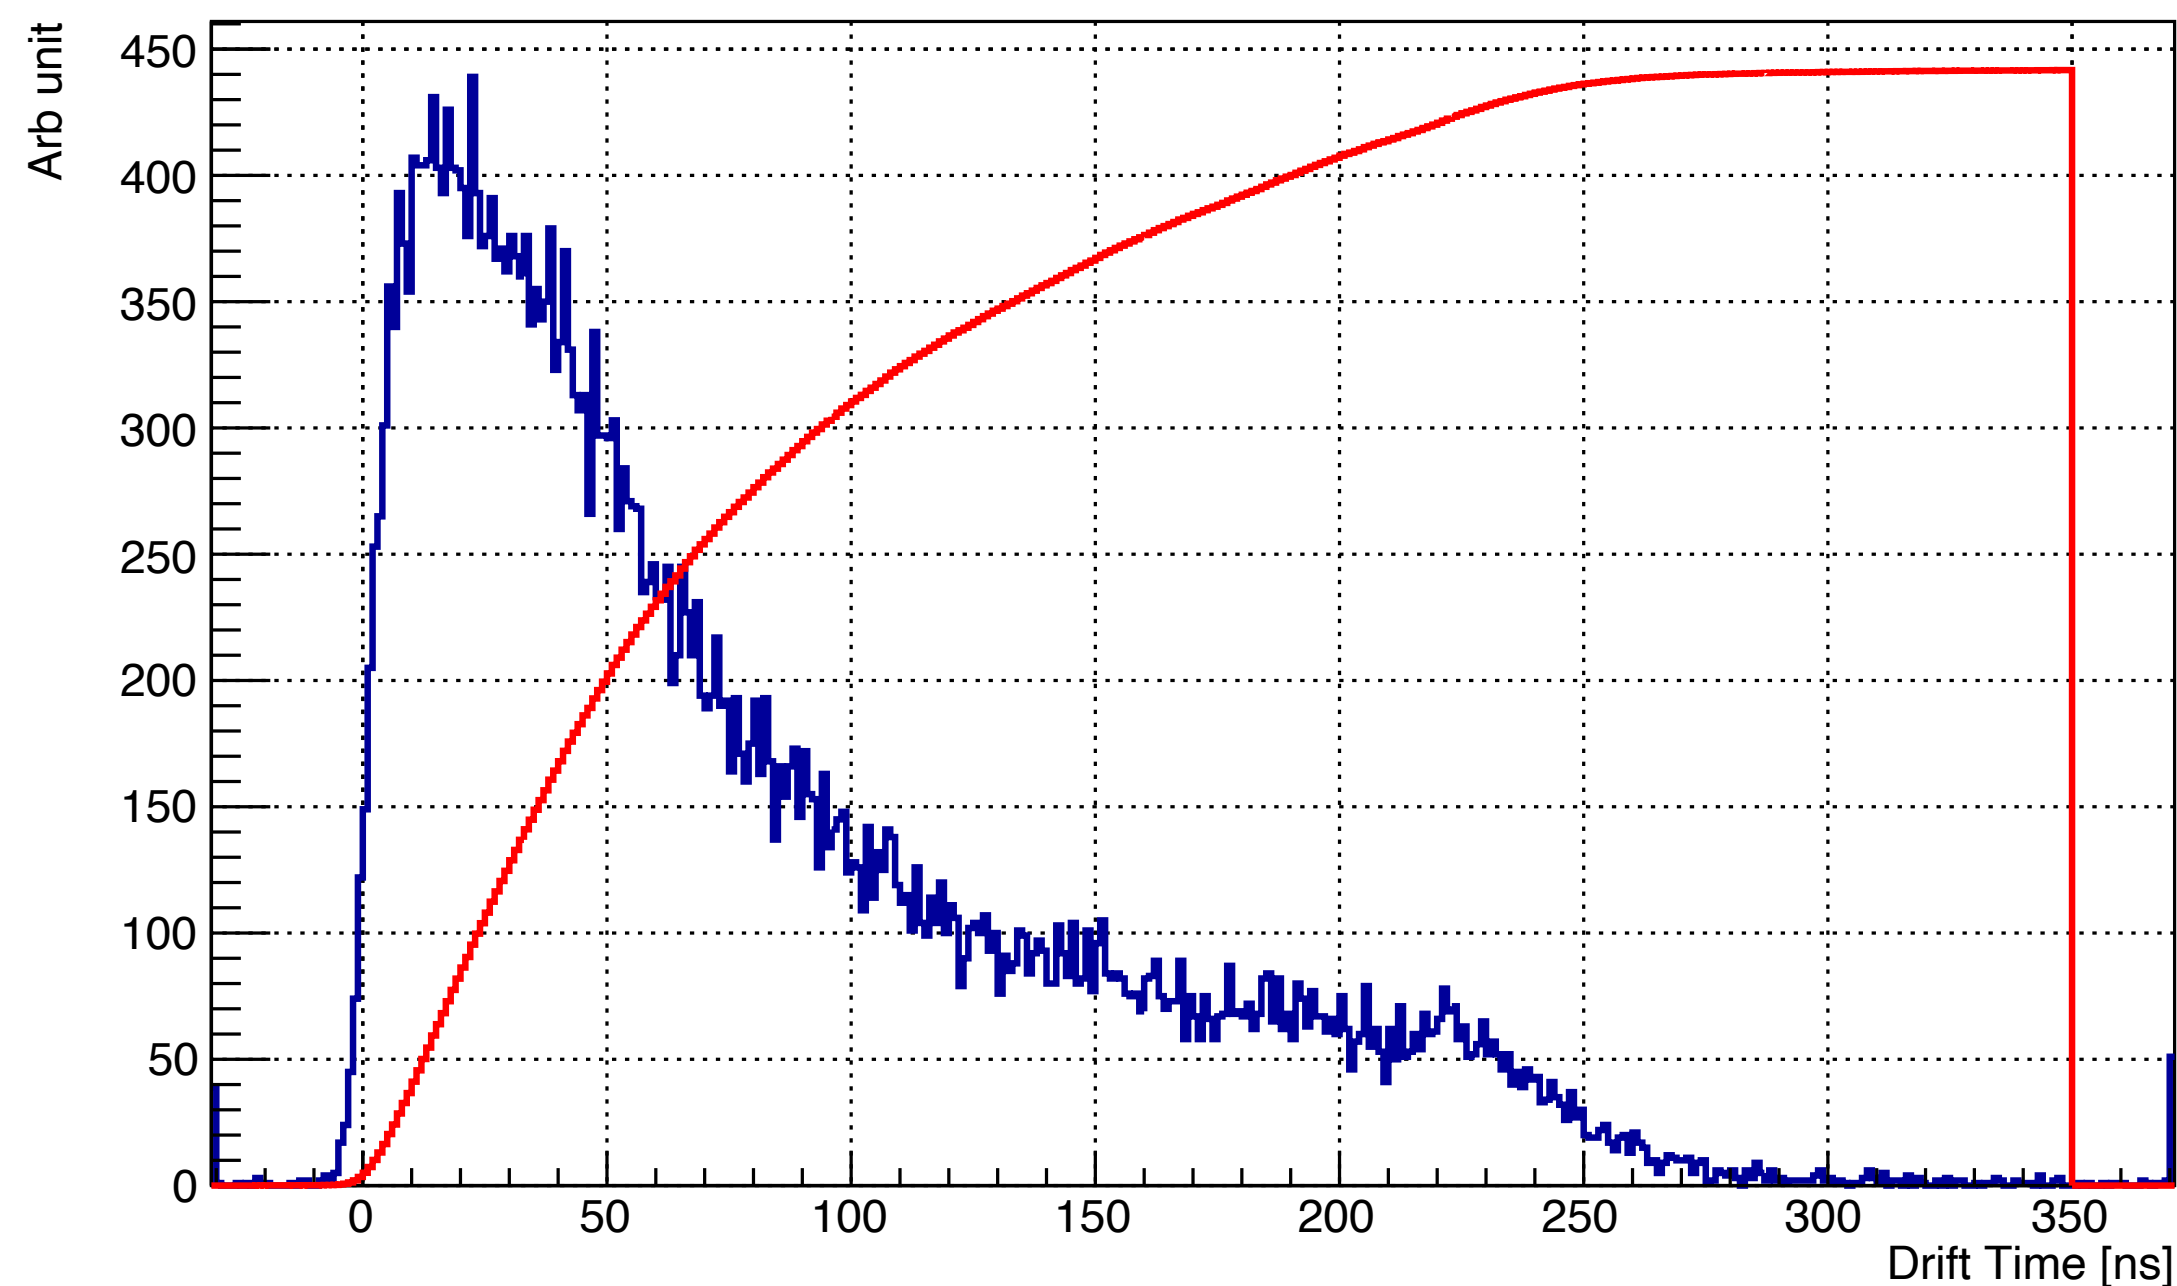

CDCTree 20sec/10k ev

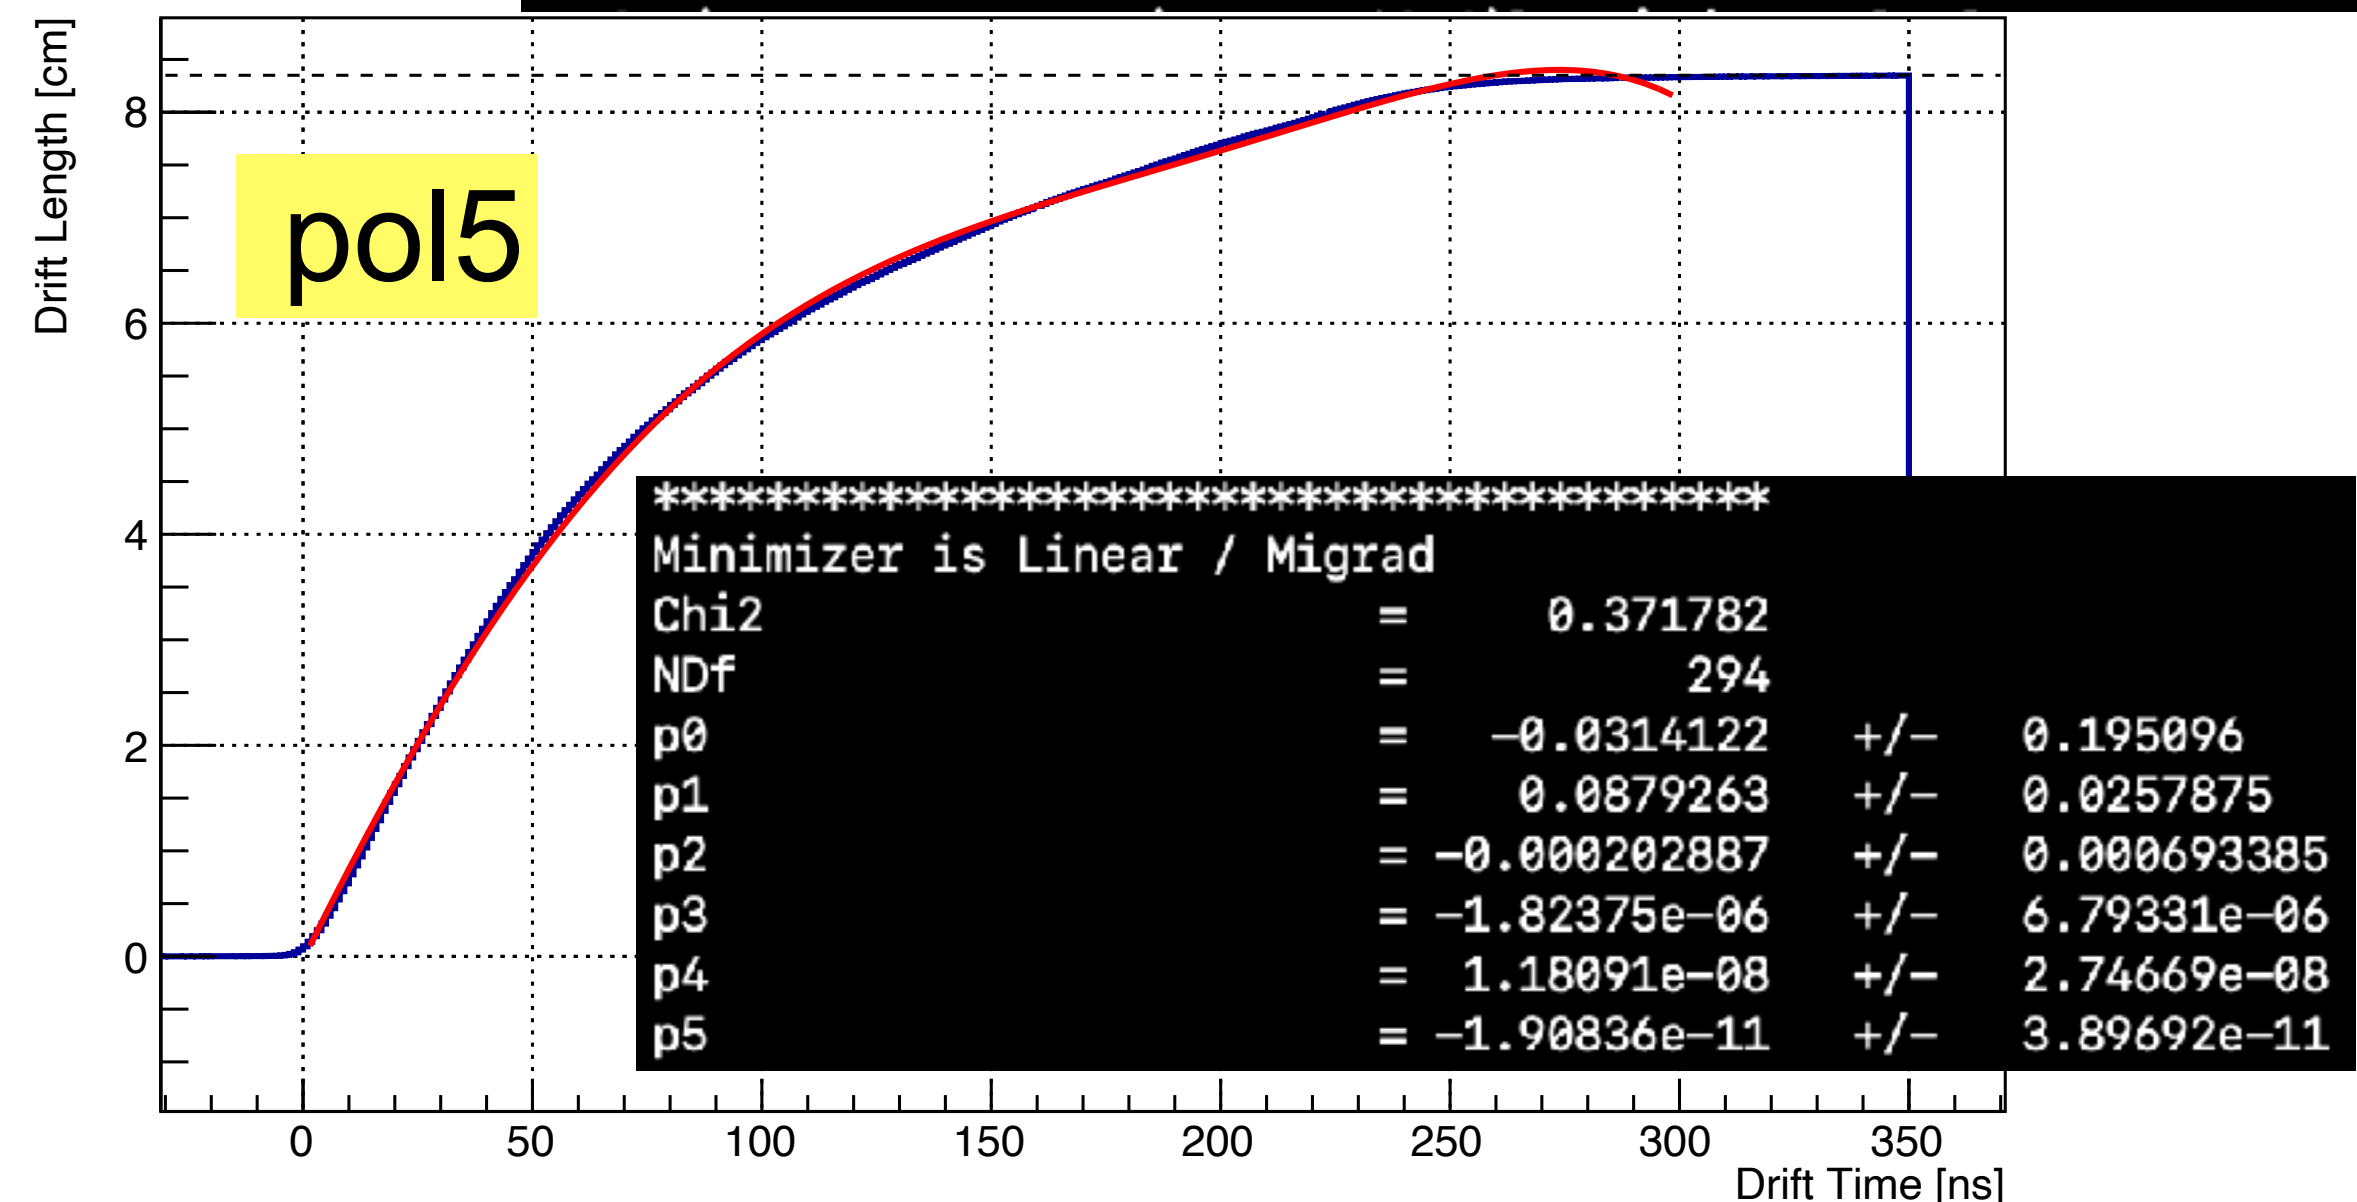

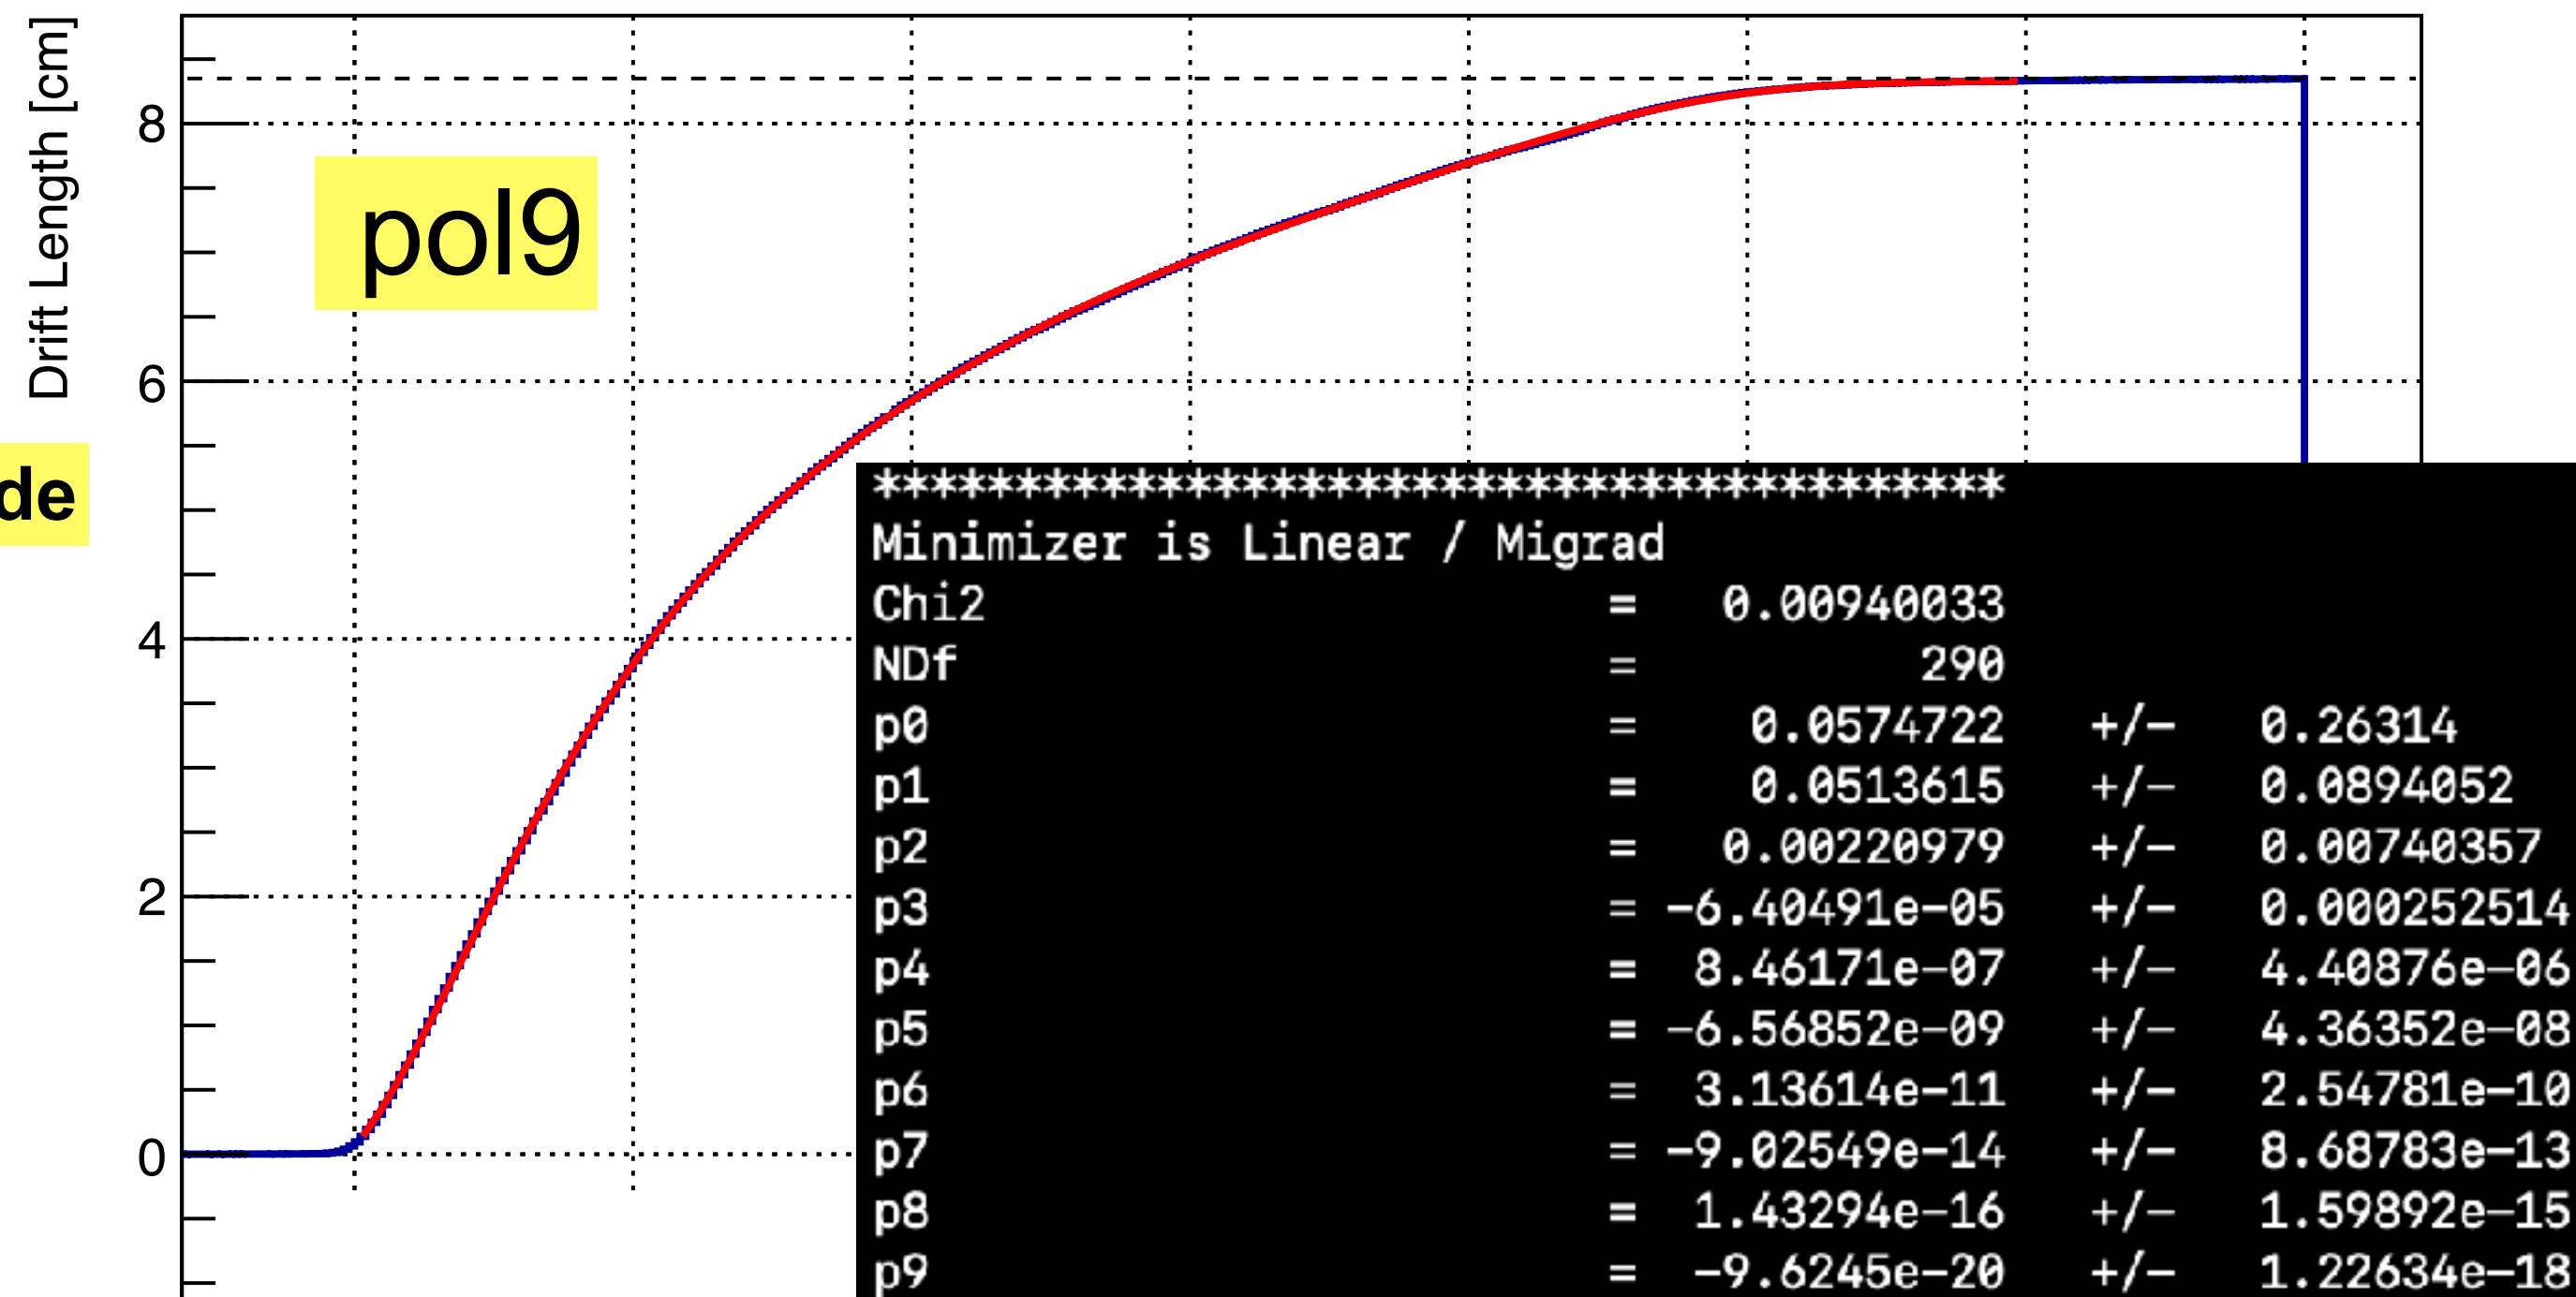

XT curve (e.g. Layer0)

- 2350 V, ArCO2, 230,000 events
- Used “dt_firstsingle TOT70”
the most clean events I can provide
- Fitted pol9, (7), 5

CDC_dt_firstsingle_TOT70_layer0 & integral

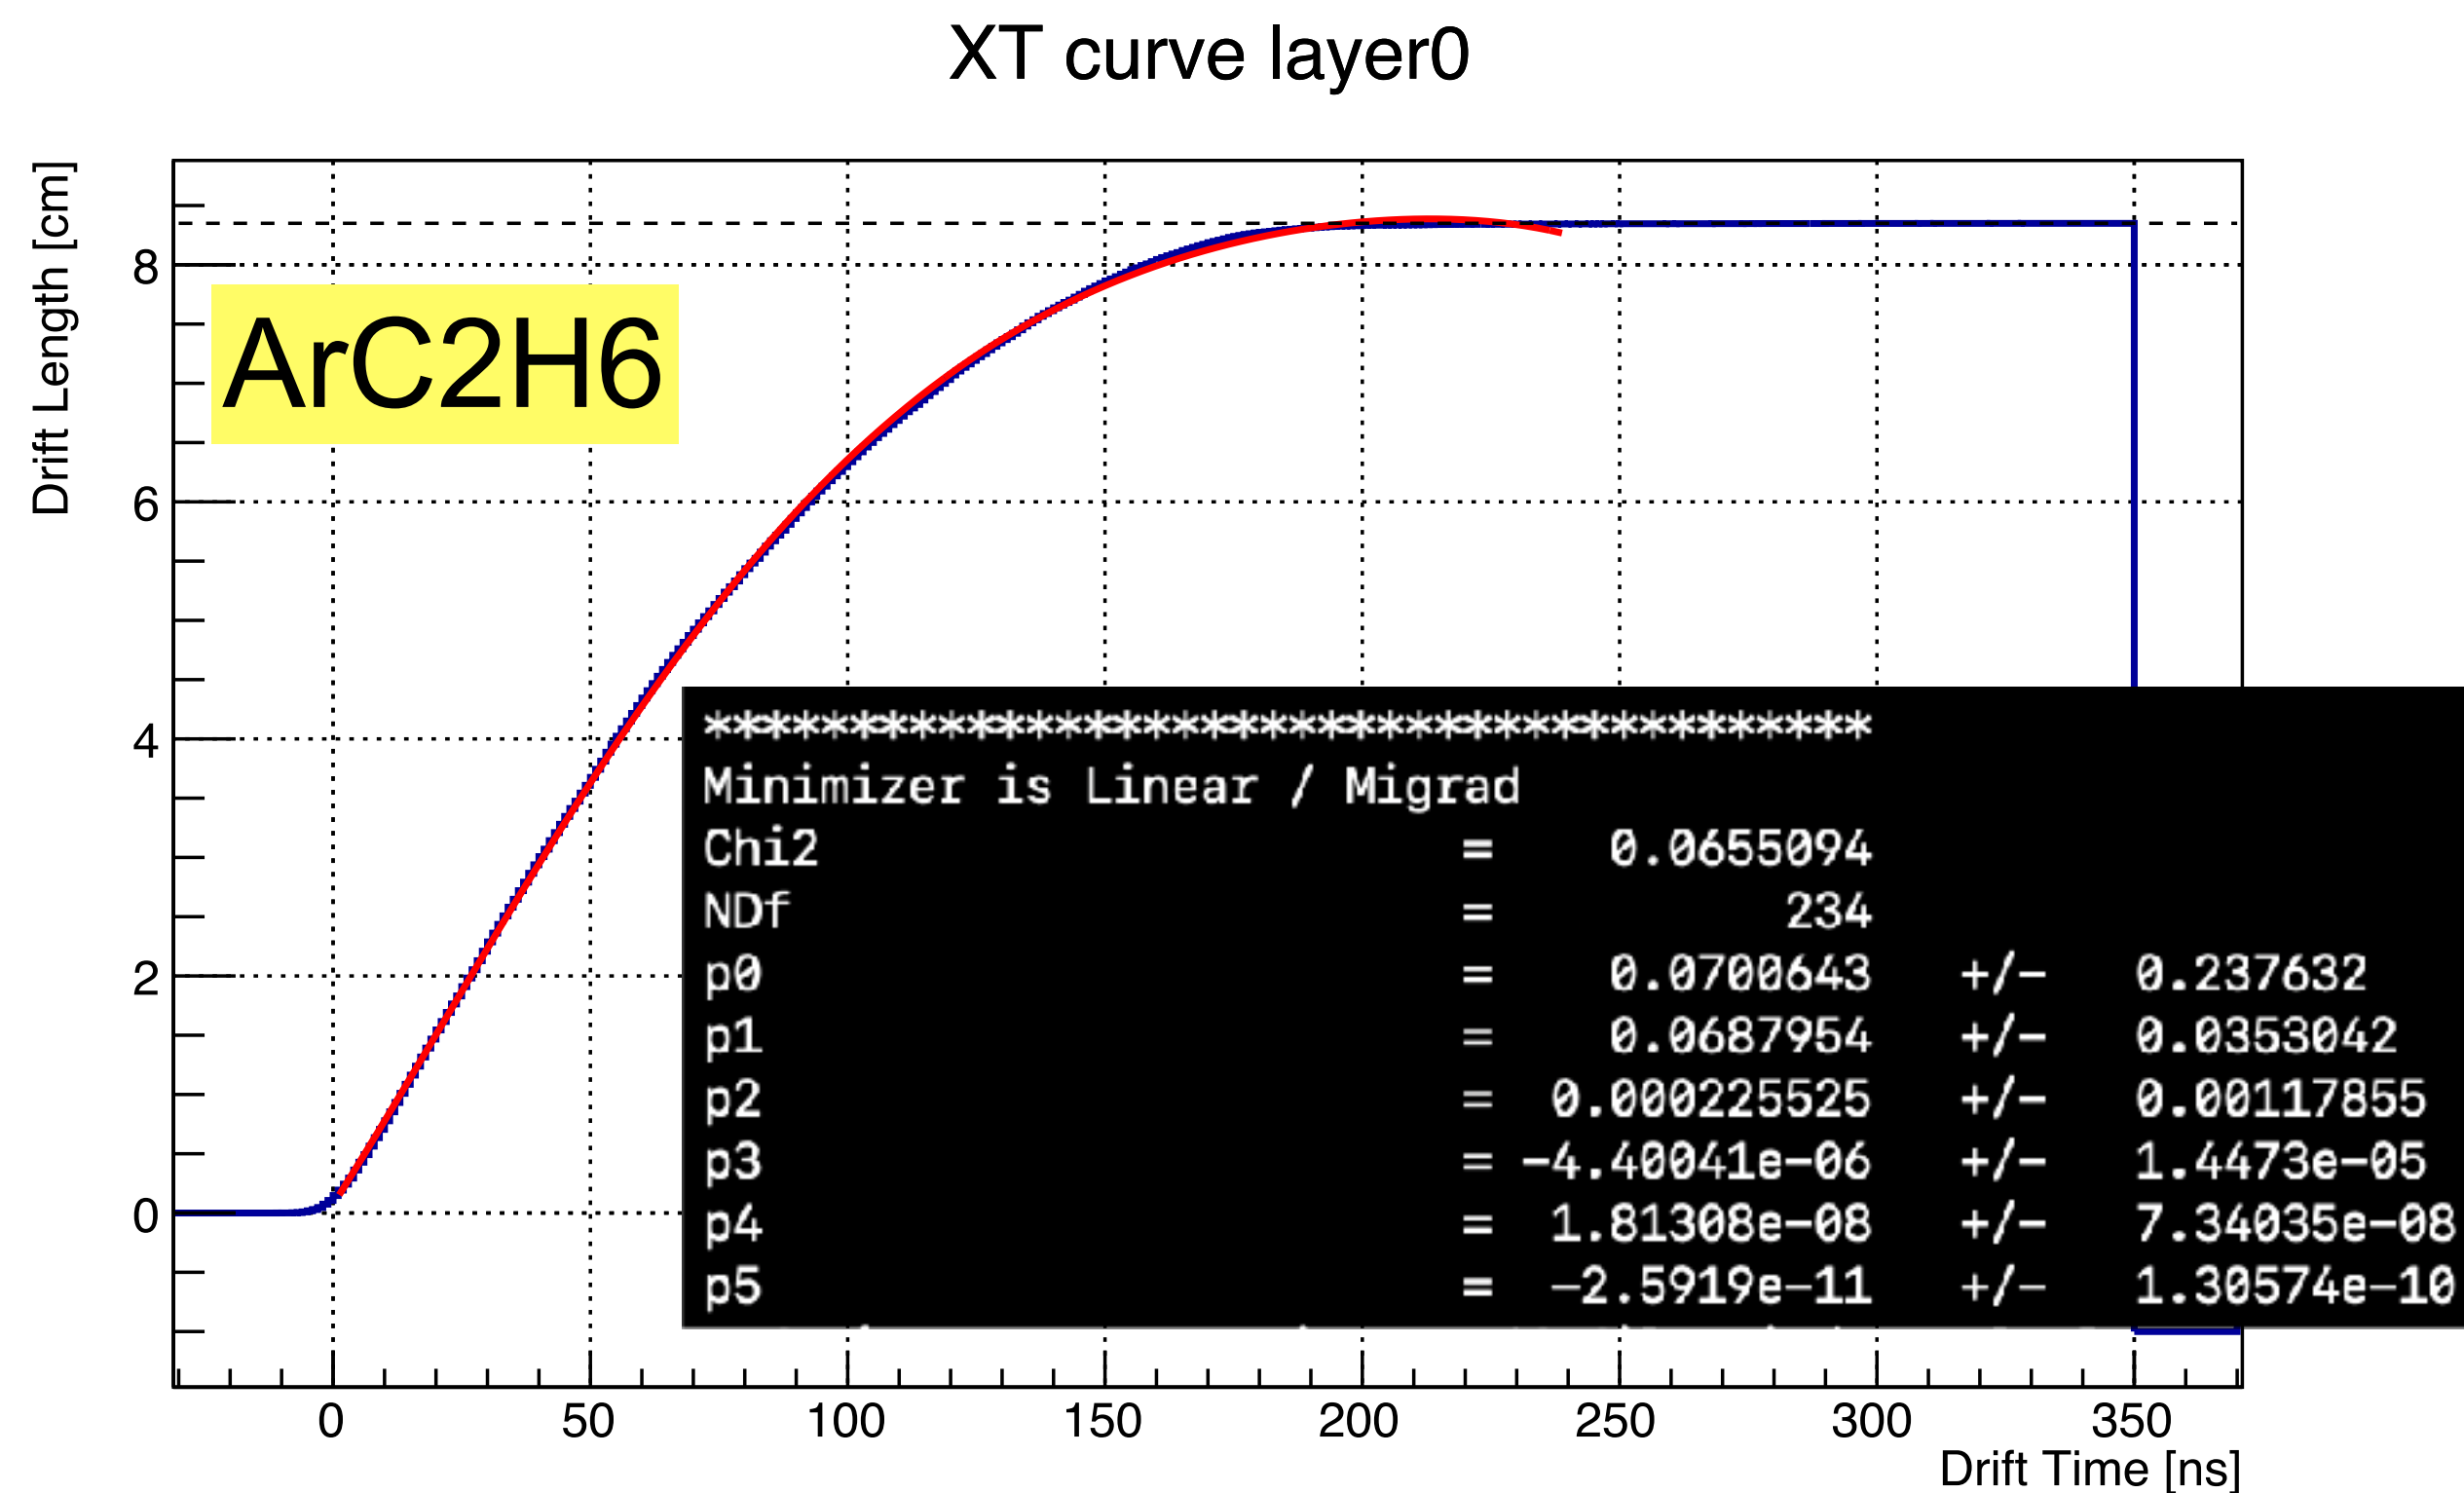

XT curve layer0

XT curve (e.g. Layer0)

- ArCO2 vs ArC2H6, 230,000 events
- Used “dt_firstsingle TOT70(40)”
the most clean events I can provide
- Fitted pol5

Should use pol5? pol9? From here, pol5.

My XT param don't work well.

Mine

XT param tune

I don't really understand.

Back Up

Raw Multiplicity 2023 vs 2024 at 2350 V (Layer0~7)

- Used run2 and run44, ArCO2 data Only Layer0~2 are aparently different each other.
- Scaled by 100,000 events 2023 has bigger Mul than 2024 in general.

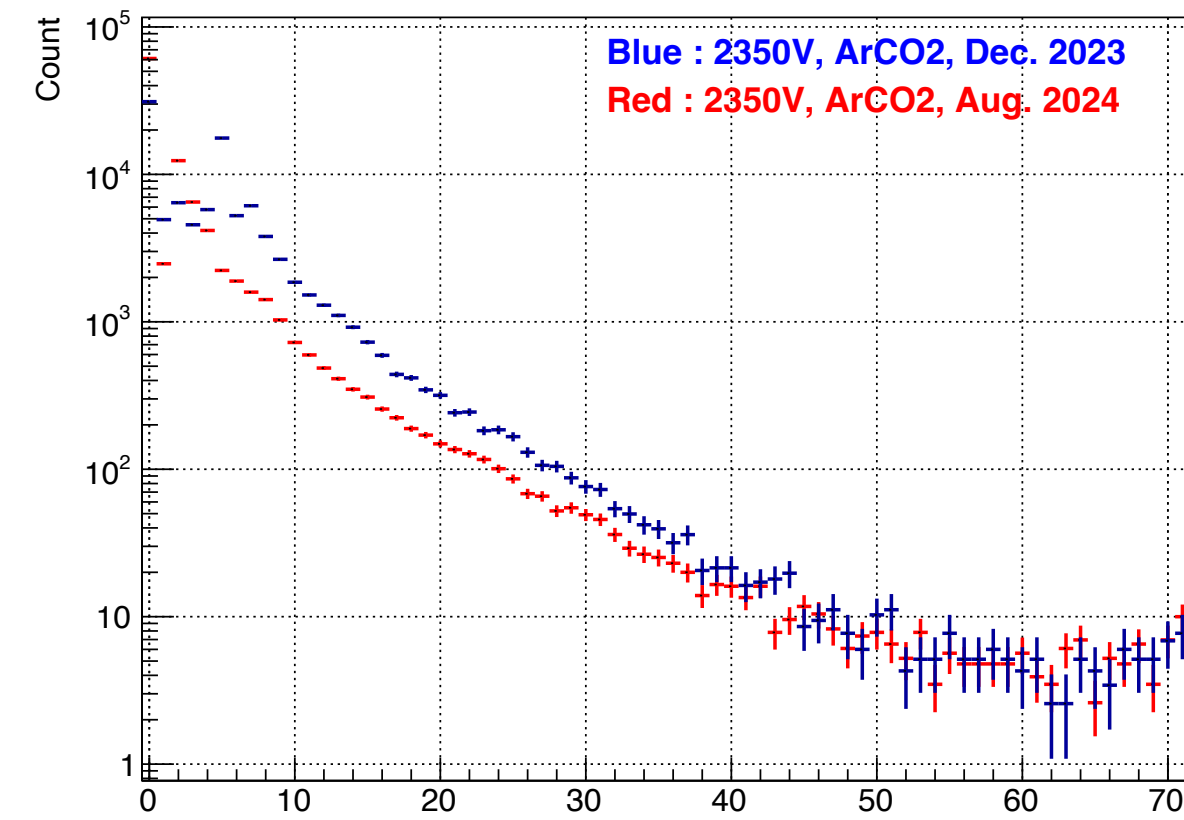

CDC_Mul_layer0

CDC_Mul_layer1

CDC_Mul_layer2

CDC_Mul_layer3

CDC_Mul_layer4

CDC_Mul_layer5

CDC_Mul_layer6

CDC_Mul_layer7

Raw Multiplicity 2023 vs 2024 at 2350 V (Layer8~14)

- Used run2 and run44, ArCO2 data Only Layer0~2 are aparently different each other.
- Scaled by 100,000 events 2023 has bigger Mul than 2024 in general.

Multiplicity 2023 vs 2024 at 2400 V (Layer8~14)

- Used run24 and run45, ArCO2 data
- Scaled by 100,000 events
- CDH 8~11, 26~29

Only Layer0~2 are aparently different each other.

2023 has bigger Mul than 2024 in general.

CDC_Mul_cdh_level2_layer0

CDC_Mul_cdh_level2_layer1

CDC_Mul_cdh_level2_layer2

CDC_Mul_cdh_level2_layer3

CDC_Mul_cdh_level2_layer4

CDC_Mul_cdh_level2_layer5

CDC_Mul_cdh_level2_layer6

CDC_Mul_cdh_level2_layer7

Multiplicity 2023 vs 2024 at 2400 V (Layer8~14)

- Used run24 and run45, ArCO2 data
- Scaled by 100,000 events
- CDH 8~11, 26~29

Only Layer0~2 are apparently different each other.

2023 has bigger Mul than 2024 in general.
